Note: Within nine months from the publication of the mention of the grant of the European patent, any person may give notice to the European Patent Office of opposition to the European patent granted. Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).

EP 0 910 964 B1

Description

[0001] The present invention relates to a vapor-permeable shoe.

[0002] It is known that a shoe, in order to be comfortable, must ensure correct exchange of heat and water vapor between the microclimate inside the shoe and the external microclimate. The exchanges of heat and vapor, however, must not compromise in any way the impermeability of the shoe to external humidity or water.

[0003] Currently commercially available shoes entrust the exchange of heat and water vapor substantially to the upper or to the sole. As regards the upper, shoes are commercially available which are perforated and/or provided with linings made of a vapor-permeable and waterproof material.

[0004] In some models, parts of the upper can be replaced with materials which are waterproof and at the same time vapor-permeable.

[0005] Another category of shoe instead entrusts transpiration to the sole, again by using layers of a waterproof and vapor-permeable material optionally associated with protective layers and fillers. These shoes, however, have not achieved an optimum exchange of heat and water vapor; accordingly, vapor-permeable shoes have been devised which are the subject of US-A-5983524, in which the shoe is constituted by the following elements: a vapor-permeable upper, associated with a vapor-permeable or perforated lining; a tread made of perforated elastomer; a mid-sole, which comprises at least one membrane made of vapor-permeable waterproof material associated with a lower protective layer made of a material which is resistant to hydrolysis, is water-repellent, vapor-permeable or perforated; and includes a vapor-permeable or perforated insole and a vapor-permeable or perforated filler layer arranged between said insole and said membrane.

[0006] The lower part of the upper, the tread and the mid-sole with the membrane are perimetricaly sealed in the regions where they join.

[0007] Although this type of shoe solves many of the drawbacks observed in commercially available vapor-permeable shoes, it is not free from drawbacks, the main drawback being the fact that the vapor-permeable and waterproof membrane is not very strong from the mechanical point of view, is not protected in an optimum manner by the lower layer and can suffer damage due to interactions with blunt objects penetrating through the holes of the tread, which extend vertically with respect to the ground.

[0008] This type of shoe furthermore entails the drawback that the paths for the outflow of the air/water vapor mixture can clog at the sole, due to dirt wedging into the holes upon use.

[0009] A tread comprising resilient microholes is known from WO 98/47 399 which falls within the ambit of Article 54(3) EPC.

[0010] The object of the present invention is to provide

a vapor-permeable shoe which solves the drawbacks noted above of conventional shoes, particularly combining optimum heat and water vapor exchange, both through the upper and through the sole, with equally optimum protection of the components accommodated inside the sole.

[0011] Within the scope of this purpose, an object of the present invention is to provide a vapor-permeable shoe in which the sole is not subject to clogging of the transpiration paths.

[0012] Another object of the present invention is to provide a vapor-permeable shoe whose structure entails absolutely no restrictions in terms of styling and aesthetic research, allowing the greatest freedom of shape and production type.

[0013] Another object of the present invention is to provide a vapor-permeable shoe which is meant both for everyday use and for sports use.

[0014] Another object of the present invention is to provide a vapor-permeable shoe whose cost is competitive with respect to known vapor-permeable shoes.

[0015] A final object of the present invention is to provide a vapor-permeable shoe which can be manufactured with known technologies.

[0016] These objects and others which will become apparent hereinafter are achieved by a vapor-permeable shoe, comprising the features of claim 1 or the features of claim 4.

[0017] Further characteristics and advantages of the present invention will become apparent from the following detailed description of two embodiments thereof, illustrated only by way of non-limitative example in the accompanying drawings, wherein:

Figure 1 is a perspective view of a first embodiment of a shoe according to the invention;

Figure 2 is a sectional view of the shoe of Figure 1; Figure 3 is a sectional view of a second embodiment of a shoe according to the invention.

[0018] With particular reference to Figures 1 and 2, a first embodiment of a vapor-permeable shoe according to the invention is generally designated by reference numeral 10.

[0019] The shoe 10 comprises a vapor-permeable upper 11 which is associated with a sole 12. The upper 11 can be associated with a vapor-permeable or perforated lining, which is not shown in the Figures. In particular, the sole 12 has a tread 13 made of an elastomer, for example rubber, which is shaped so as to form a plurality of domes 14 having a convexity directed toward the ground.

[0020] Each one of the domes 14 has, substantially at a top portion thereof, a minute through slit 15 which is normally closed by virtue of the elasticity of the material and allows the outflow of the air/water vapor mixture that has formed inside the shoe when the compression of the sole of the foot generates an overpressure at the

chambers 16 formed internally by the domes 14.

[0021] The shoe 10 also comprises an insole 17, which in this case is perforated but can also be vapor-permeable, and a waterproof and vapor-permeable membrane 18 of the type known commercially as Gore-Tex.

[0022] In particular, in this case the membrane 18 is associated with a lower protective layer 19 made of a material which is resistant to hydrolysis, and is water-repellent, vapor-permeable or perforated. The membrane 18, together with the layer 19, has an edge 20 which is embedded in the tread 13 so as to seal the joint. A seal is also provided between the upper 11 and the tread 13.

[0023] As regards operation, the overpressure generated inside the shoe vents air through the insole 17, the membrane 18 with the layer 19, and the minute slits 15 of the tread 13, which act as one-way valves by virtue of the particular dome-like configuration of the regions in which they are located. Accordingly, air flow occurs in a single direction.

[0024] Impermeability is ensured by the combined effect of the membrane 18 with the minute slits 15, which are normally closed.

[0025] With particular reference to Figure 3, a second embodiment of the vapor-permeable shoe according to the invention is generally designated by reference numeral 100.

[0026] In particular, the shoe 100 comprises an upper 101 (with an optional vapor-permeable or perforated lining, not shown), associated with a sole 102 which is in turn constituted by a tread 103 made of elastomer and shaped so as to form a plurality of domes 104 having a convexity directed toward the ground, each dome being provided with a minute through slit 105 which is normally closed by virtue of the elasticity of the material and allows the outflow of the mixture of air and water vapor, as described above.

[0027] The shoe 100 further comprises a vapor-permeable or perforated insole 106 and, between the insole and the tread 103, an intermediate element is provided which is generally designated by reference numeral 107 and is described hereinafter. In particular, the intermediate element 107 is shaped so as to form, at the surface that is directed toward the insole 106, a plurality of first raised portions 108 which are suitable to support the insole and keep it spaced.

[0028] The intermediate element 107 is also shaped at the surface that is directed toward the tread 103 so as to form a plurality of second conical raised portions 109, each of which is inserted in a corresponding chamber 110 formed by the corresponding dome 104.

[0029] In particular, each one of the second raised portions 109 is suitable to close the opening of the corresponding chamber 110 when it is pushed and compressed by the sole of the foot, not shown, which rests thereon.

[0030] Through holes 111 are provided in the interme-

diate element 107 in order to allow the flow of air between the upper region and the lower region. The upper 101, the intermediate element 107 and the tread 103 are sealed in the regions where they join.

[0031] The intermediate element 107 provides outward mechanical pumping, through the minute slits 105, of the air that is in the regions between the second conical raised portions 109 and the domes 104, when the conical raised portions 109 perform alternating movements due to walking, particularly with downward movements after they have closed the corresponding chambers 110 and compressed the air contained therein. The flow of air is unidirectional and a good impermeability effect is ensured by the fact that the minute slits 105 are normally closed.

[0032] In a different embodiment, not shown in the Figures, it is possible to arrange between the intermediate element 107 and the insole 106 a membrane 18, optionally associated with a protective layer such as 19.

[0033] In practice it has been observed that the present invention has solved the intended aim and objects. In particular, it should be noted that the shoe according to the invention combines the need to provide optimum foot transpiration with the possibility to adequately protect the components inside the sole.

[0034] It should also be noted that the first embodiment combines the impermeability and vapor-permeability advantages of the membrane-fitted shoes cited in the introduction with the advantages of shoes in which the transfer of the air contained therein is performed mechanically with valves actuated by the compression of the foot during walking.

[0035] It should also be noted that the shoe according to the invention, in addition to being particularly tough, is substantially impermeable to external water vapor and water.

[0036] It is further noted that the structure of the shoe according to the invention does not compromise in any way research in terms of quality styling and aesthetic solutions.

[0037] It should also be noted that the constructive simplicity of the shoe according to the invention allows the achievement of production costs which are competitive with respect to similar commercially available shoes.

[0038] The present invention is capable of numerous modifications and variations within the scope of the appended claims.

[0039] The constructive details discussed can be replaced with other technically equivalent elements falling within the scope of the appended claims. The materials and the dimensions may be any according to requirements.

[0040] Where technical features mentioned in any claim are followed by reference signs, those reference signs have been included for the sole purpose of increasing the intelligibility of the claims and accordingly, such reference signs do not have any limiting effect on

the interpretation of each element identified by way of example by such reference signs.

Claims

1. A vapor-permeable shoe (10) comprising:

an upper (11);
 a tread (13) made of an elastomer, said tread being shaped so as to form a plurality of domes (14) having a convexity directed toward the ground, each dome forming a chamber (16) and having at least one minute through slit (15) which is normally closed due to the elasticity of the material and allows outflow of a mixture of air and water vapor formed inside the shoe when compression applied by the sole of the foot of a user generates an overpressure at the chambers formed internally by said dome;
 a vapor-permeable or perforated insole (17); and
 a waterproof and vapor-permeable membrane (18) interposed between said insole and said tread, the lower part of said upper, said tread and said membrane being perimetricaly sealed in regions where said tread and said membrane are joined.

2. The vapor-permeable shoe according to claim 1, characterized in that said upper is vapor-permeable and is associated with a vapor-permeable or perforated lining.

3. The vapor-permeable shoe according to claim 1, characterized in that it comprises a protective layer made of a material which is resistant to hydrolysis, is water-repellent, vapor-permeable or perforated and is directed toward the tread and which contacts said membrane.

4. A vapor-permeable shoe (100) comprising

an upper (101);
 a tread (103) made of an elastomer, said tread being shaped so as to form a plurality of domes (104) having a convexity directed toward the ground, each dome forming a chamber and having at least one minute through slit (105) which is normally closed due to the elasticity of the material and allows the outflow of a mixture of air and water vapor formed inside the shoe when compression applied by the sole of the foot of the user generates an overpressure at the chambers formed internally by said domes;
 a vapor-permeable or perforated insole (106);
 a perforated intermediate element (107), said element being shaped so as to form, at a sur-

face that is directed toward the tread, a plurality of conical raised portions (109), each of which is inserted in a corresponding chamber (110) formed by a corresponding dome and closes said corresponding chamber when pushed and compressed by the sole of a foot of a wearer that rests thereon.

5. The vapor-permeable shoe according to claim 4, characterized in that said upper is vapor-permeable and is associated with a vapor-permeable or perforated lining.

6. The shoe according to claim 4, characterized in that said intermediate element has, at a surface directed toward the insole, a plurality of raised portions which are suitable to support said insole and keep it spaced from said domes.

7. The shoe according to claim 4, characterized in that a vapor-permeable and waterproof membrane is arranged between said intermediate element and said insole.

8. The shoe according to claim 7, characterized in that it comprises a lower protective layer made of a material which is resistant to hydrolysis, is water-repellent, vapor-permeable or perforated and which is directed toward the tread and contacts said membrane.

Patentansprüche

1. Dampfdurchlässiger Schuh (10), welcher folgendes aufweist:

ein Oberteil (11);
 eine Lauffläche (13), welche aus einem Elastomer hergestellt ist, wobei die Lauffläche derart geformt ist, daß sich eine Mehrzahl von kuppelförmigen Auswölbungen (14) bildet, welche eine in Richtung zu dem Untergrund gerichtete Konvexität haben, wobei jede kuppelförmige Auswölbung eine Kammer (16) bildet, und wenigstens einen winzigen Durchgangsschlitz (15) hat, welcher im Grundzustand infolge der Elastizität des Materials geschlossen ist, und ein Ausströmen eines Gemisches aus Luft und Wasserdampf gestattet, welches sich im Innern des Schuhs bildet, wenn eine Kompression durch die Sohle des Fußes des Trägers einwirkt, welcher einen Überdruck an den Kammern erzeugt, die im Innern von der kuppelförmigen Auswölbung gebildet werden;
 eine dampfdurchlässige oder perforierte Innensohle (17); und
 eine wasserdichte und dampfdurchlässige

Membrane (18), welche zwischen der Innensohle und der Lauffläche angeordnet ist, wobei der untere Teil des Oberteils, die Lauffläche und die Membrane am Umriss an Bereichen abgedichtet sind, an denen die Lauffläche und die Membrane verbunden sind.

2. Dampfdurchlässiger Schuh nach Anspruch 1, **dadurch gekennzeichnet, daß** das Oberteil dampfdurchlässig ist und mit einem dampfdurchlässigen oder perforierten Überzug verbunden ist.
3. Dampfdurchlässiger Schuh nach Anspruch 1, **dadurch gekennzeichnet, daß** er eine Schutzschicht aus einem Material aufweist, welches hydrolysebeständig, wasserabstoßend, dampfdurchlässig oder perforiert ist, und in Richtung auf die Lauffläche weist, sowie die Membrane berührt.
4. Dampfdurchlässiger Schuh (100), welcher folgendes aufweist:

ein Oberteil (101);
 eine Lauffläche (103), welche aus einem elastomeren Material hergestellt ist, wobei die Lauffläche derart ausgebildet ist, daß sich eine Mehrzahl von kuppelförmigen Auswölbungen (104) bildet, welche eine in Richtung zu dem Untergrund weisende Konvexität haben, wobei jede kuppelförmige Auswölbung eine Kammer bildet und wenigstens einen winzigen Durchgangsschlitz (105) hat, welcher infolge der Elastizität des Materials im Grundzustand geschlossen ist, und ein Ausströmen eines Gemisches aus Luft und Wasserdampf gestattet, welches im Innern des Schuhs gebildet wird, wenn eine Kompression durch die Sohle des Fußes des Trägers aufgebracht wird, und ein Überdruck an den Kammern erzeugt wird, die im Innern durch die kuppelförmigen Auswölbungen gebildet werden;
 eine dampfdurchlässige oder perforierte Innensohle (106);
 ein perforiertes Zwischenelement (107), welches derart ausgebildet ist, daß sich an einer Oberfläche, die in Richtung zu der Lauffläche weist, eine Mehrzahl von konischen, erhabenen Abschnitten (109) bildet, die jeweils in eine zugeordnete Kammer (110) eingeführt sind, welche von einer zugeordneten kuppelförmigen Auswölbung gebildet wird, die jeweils die zugeordnete Kammer schließen, wenn durch die Sohle eines Fußes eines Trägers eine Druckkraft aufgebracht und ein Komprimieren bewirkt wird, die hierauf aufliegt.

5. Dampfdurchlässiger Schuh nach Anspruch 4, **dadurch gekennzeichnet, daß** das Oberteil dampf-

durchlässig und mit einem dampfdurchlässigen oder perforierten Überzug versehen ist.

6. Schuh nach Anspruch 4, **dadurch gekennzeichnet, daß** das Zwischenelement an einer Fläche, die zur Innensohle zugewandt liegt, eine Mehrzahl von erhabenen Abschnitten hat, die in geeigneter Weise die Innensohle abstützen und diese von den kuppelförmigen Auswölbungen beabstandet halten.
7. Schuh nach Anspruch 4, **dadurch gekennzeichnet, daß** eine dampfdurchlässige und wasserdichte Membrane zwischen dem Zwischenelement und der Innensohle angeordnet ist.
8. Schuh nach Anspruch 7, **dadurch gekennzeichnet, daß** er eine untere Schutzschicht aus einem Material aufweist, welches hydrolysebeständig, wasserabstoßend, dampfdurchlässig oder perforiert ist, und die der Lauffläche zugewandt liegt, sowie die Membrane berührt.

Revendications

1. Chaussure perméable à la vapeur (10) comprenant :

une tige (11) ;
 une semelle (13) faite d'un élastomère, ladite semelle étant conformée de manière à former une pluralité de dômes (14) ayant une convexité dirigée vers le sol, chaque dôme formant une chambre (16) et ayant au moins une très petite fente traversante (15) qui est normalement fermée sous l'effet de l'élasticité de la matière et qui permet un écoulement extérieur d'un mélange d'air et de vapeur d'eau formé à l'intérieur de la chaussure lorsqu'une compression appliquée par la plante du pied d'un utilisateur engendre une surpression au niveau des chambres formées intérieurement par ledit dôme ;
 une première (17) perméable à la vapeur ou perforée ; et
 une membrane étanche à l'eau et perméable à la vapeur (18) interposée entre ladite première et ladite semelle, la partie inférieure de ladite tige, ladite semelle et ladite membrane étant scellées de façon périmétrique dans des régions où ladite semelle et ladite membrane sont réunies.

2. Chaussure perméable à la vapeur selon la revendication 1, **caractérisée en ce que** ladite tige est perméable à la vapeur et est associée à une doublure perméable à la vapeur ou perforée.

3. Chaussure perméable à la vapeur selon la revendication 1, **caractérisée en ce qu'elle** comprend une couche protectrice faite d'une matière qui est résistante à l'hydrolyse, qui est hydrophobe, perméable à la vapeur ou perforée et est dirigée vers la semelle et qui est en contact avec ladite membrane. 5
4. Chaussure perméable à la vapeur (100), comprenant : 10
- une tige (101) ;
- une semelle (103) faite d'un élastomère, ladite semelle étant conformée de manière à former une pluralité de dômes (104) ayant une convexité dirigée vers le sol, chaque dôme formant une chambre et ayant au moins une très petite fente traversante (105) qui est normalement fermée sous l'effet de l'élasticité de la matière, et qui permet un écoulement extérieur d'un mélange d'air et de vapeur d'eau formé à l'intérieur de la chaussure lorsqu'une compression appliquée par la plante du pied de l'utilisateur engendre une surpression au niveau des chambres formées intérieurement par lesdits dômes ; 15 20 25
- une première (106) perméable à la vapeur ou perforée ;
- un élément intermédiaire perforé (107), ledit élément étant conformé de manière à former, au niveau d'une surface qui est dirigée vers la semelle, une pluralité de portions en relief coniques (109) dont chacune est insérée dans une chambre (110) correspondante formée par un dôme correspondant et ferme ladite chambre correspondante lorsqu'elle est poussée et comprimée par la plante d'un pied d'une personne portant la chaussure qui repose sur elle. 30 35
5. Chaussure perméable à la vapeur selon la revendication 4, **caractérisée en ce que** ladite tige est perméable à la vapeur et est associée à une doublure perméable à la vapeur ou perforée. 40
6. Chaussure selon la revendication 4, **caractérisée en ce que** ledit élément intermédiaire possède, au niveau d'une surface dirigée vers la première, une pluralité de portions en relief qui sont appropriées pour supporter ladite première et la maintenir espacée desdits dômes. 45 50
7. Chaussure selon la revendication 4, **caractérisée en ce qu'une** membrane perméable à la vapeur et étanche à l'eau est disposée entre ledit élément intermédiaire et ladite première. 55
8. Chaussure selon la revendication 7, **caractérisée en ce qu'elle** comprend une couche protectrice in-

férieure faite d'une matière qui est résistante à l'hydrolyse, qui est hydrophobe, perméable à la vapeur ou perforée, et qui est dirigée vers la semelle et est en contact avec ladite membrane.
